

Influenza Surveillance Report

2022 MMWR Week 18 (ending May 7th, 2022)

This report is in the process of format change to provide more detailed interpretation. Expect edits over the next few weeks. The original report analyzed the influenza-like illness (ILI) designation in ESSENCE, which defines ILI based on general symptoms (e.g., fever, sore throat, and cough) associated with influenza, but can also be symptoms of other illnesses (e.g., RSV or COVID). New to this report is the inclusion of the evaluation of the percentage ILI due to non-Influenza discharge diagnoses.

HOUSTON HEALTH DEPARTMENT

HOUSTONHEALTH.ORG

Summary

Objective: To monitor trends in influenza and influenza-like visits to facilities reporting to the Southeast Texas Syndromic Surveillance System (HHD-ESSENCE) in Houston/Harris County for public health intervention.

Time Frame: January 3, 2021 (start of 2021 MMWR Week 1) to May 7, 2022 (end of 2022 MMWR Week 18).

Summary:

- The 5-week average counts of ILI are on a steady to slight upward trend and 5-week average counts of Discharge Diagnosed are on a downward trend.
- For the past 5 weeks, the percentage of visits due to ILI is on a slight upward trend.
- For the past 5 weeks, the percentage of visits due to discharge diagnosed influenza is on a downward trend.
- Recently, children under 18 have a slightly higher percentage of visits due to ILI compared to adults 18 and over (no change from previous week). Both age groups are on a steady/slight downward trend for this measure.
- Recently, children under 18 have a higher percentage of visits due to discharge diagnosed influenza compared to adults 18 and over (no change from previous week). Both age groups are on a downward trend for this measure.

	5-week Trend	Change from Previous Week	Current Week (2022 MMWR Week 18)	Current Week (2022 MMWR Week 17)	Trend in Texas	Trend in U.S.
Percentage of Visits due to ILI	Increasing	+0.06%	0.67%	0.61%	Decreasing	Increasing
Percentage of Visits due to Discharge Diagnosed Influenza	Decreasing	-0.04%	0.81%	0.85%	N/A	N/A

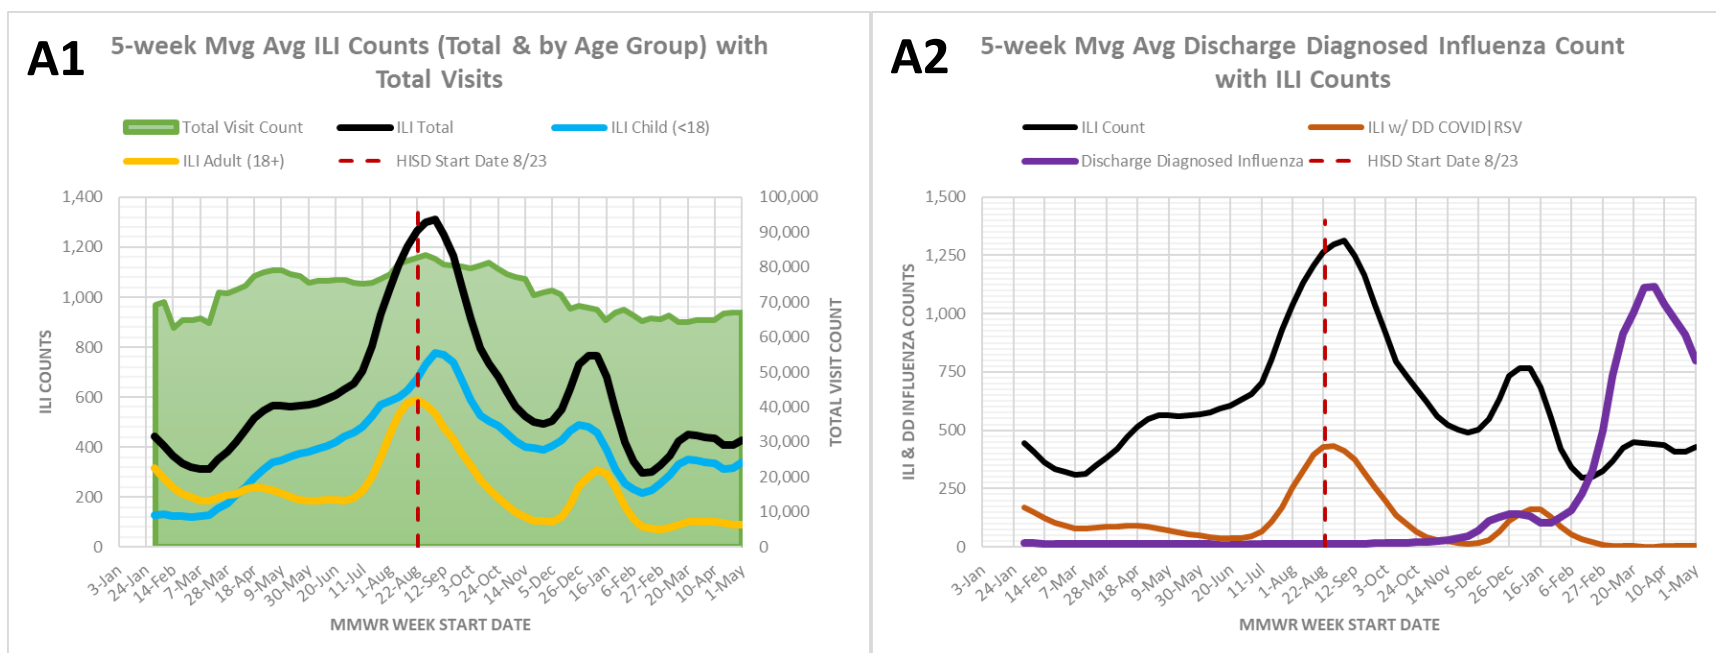

Figure A1. ILI Counts (Total, Child, & Adult) with Total Visit Count (5-week Moving Averages).

Figure A2. Discharge Diagnosed Influenza with ILI Counts, including Total & Discharge Diagnosed COVID or RSV (5-week Moving Averages).

The 5-week average counts of ILI are on a steady to slight upward trend and 5-week average counts of Discharge Diagnosed are on a downward trend.

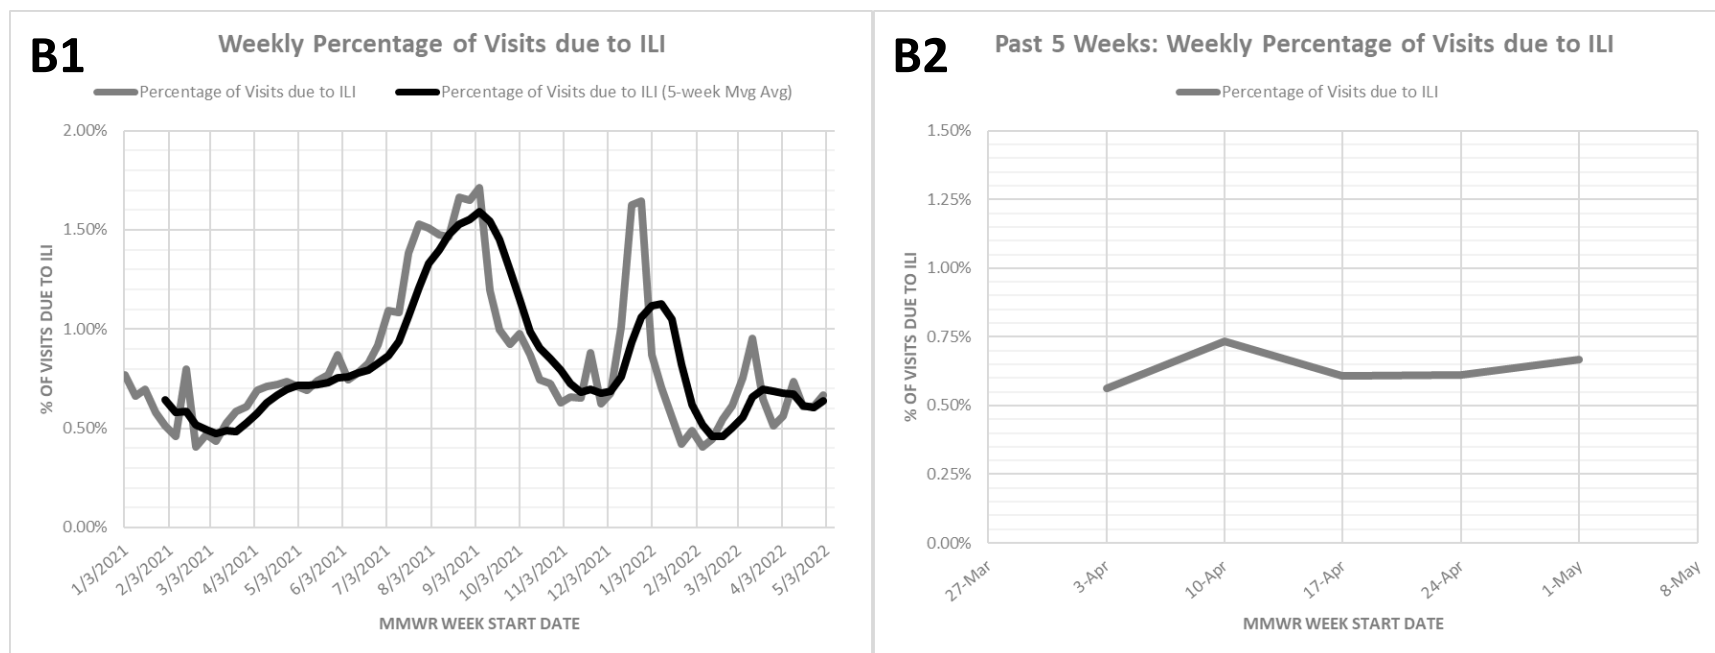

Figure B1. Percentage of Visits due to ILI with 5-week moving average.

Figure B2. Percentage of Visits due to ILI in the past 5 weeks (MMWR 2022 Week #14 to #18).

For the past 5 weeks, the percentage of visits due to ILI is on a slight upward trend.

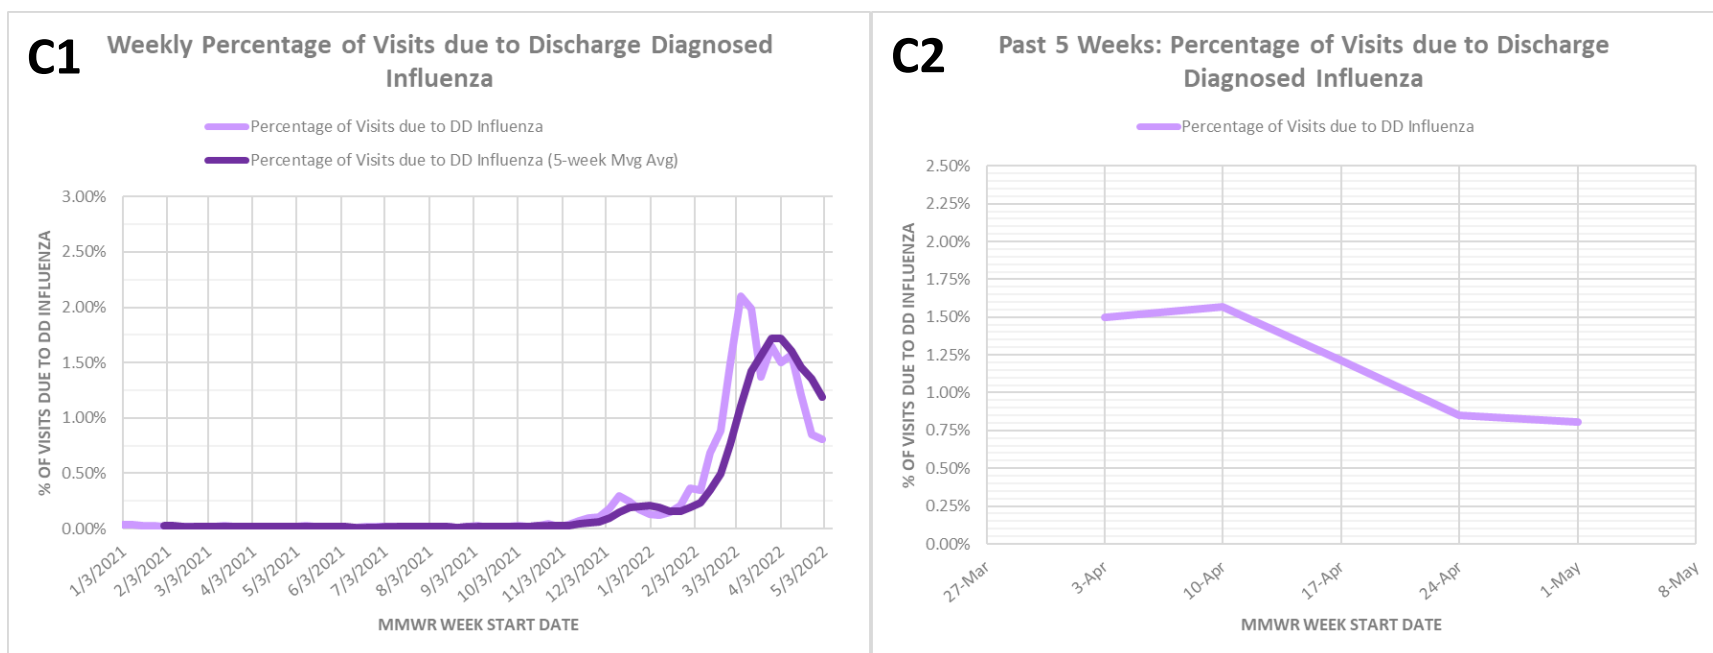

Figure C1. Percentage of Visits due to Discharge Diagnosed Influenza with 5-week moving average.

Figure C2. Percentage of Visits due to Discharge Diagnosed Influenza in the past 5 weeks (MMWR 2022 Week #14 to #18).

For the past 5 weeks, the percentage of visits due to discharge diagnosed influenza is on a downward trend.

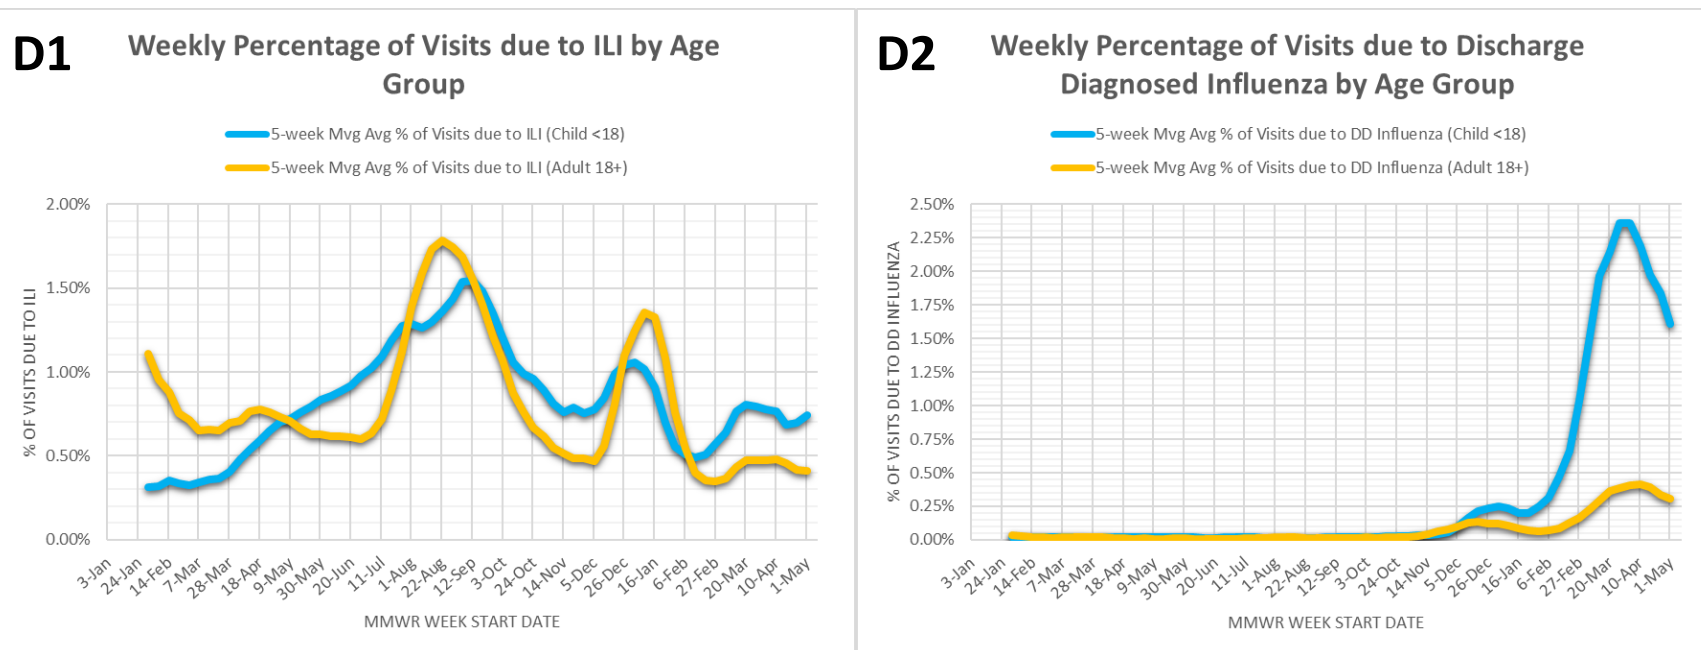

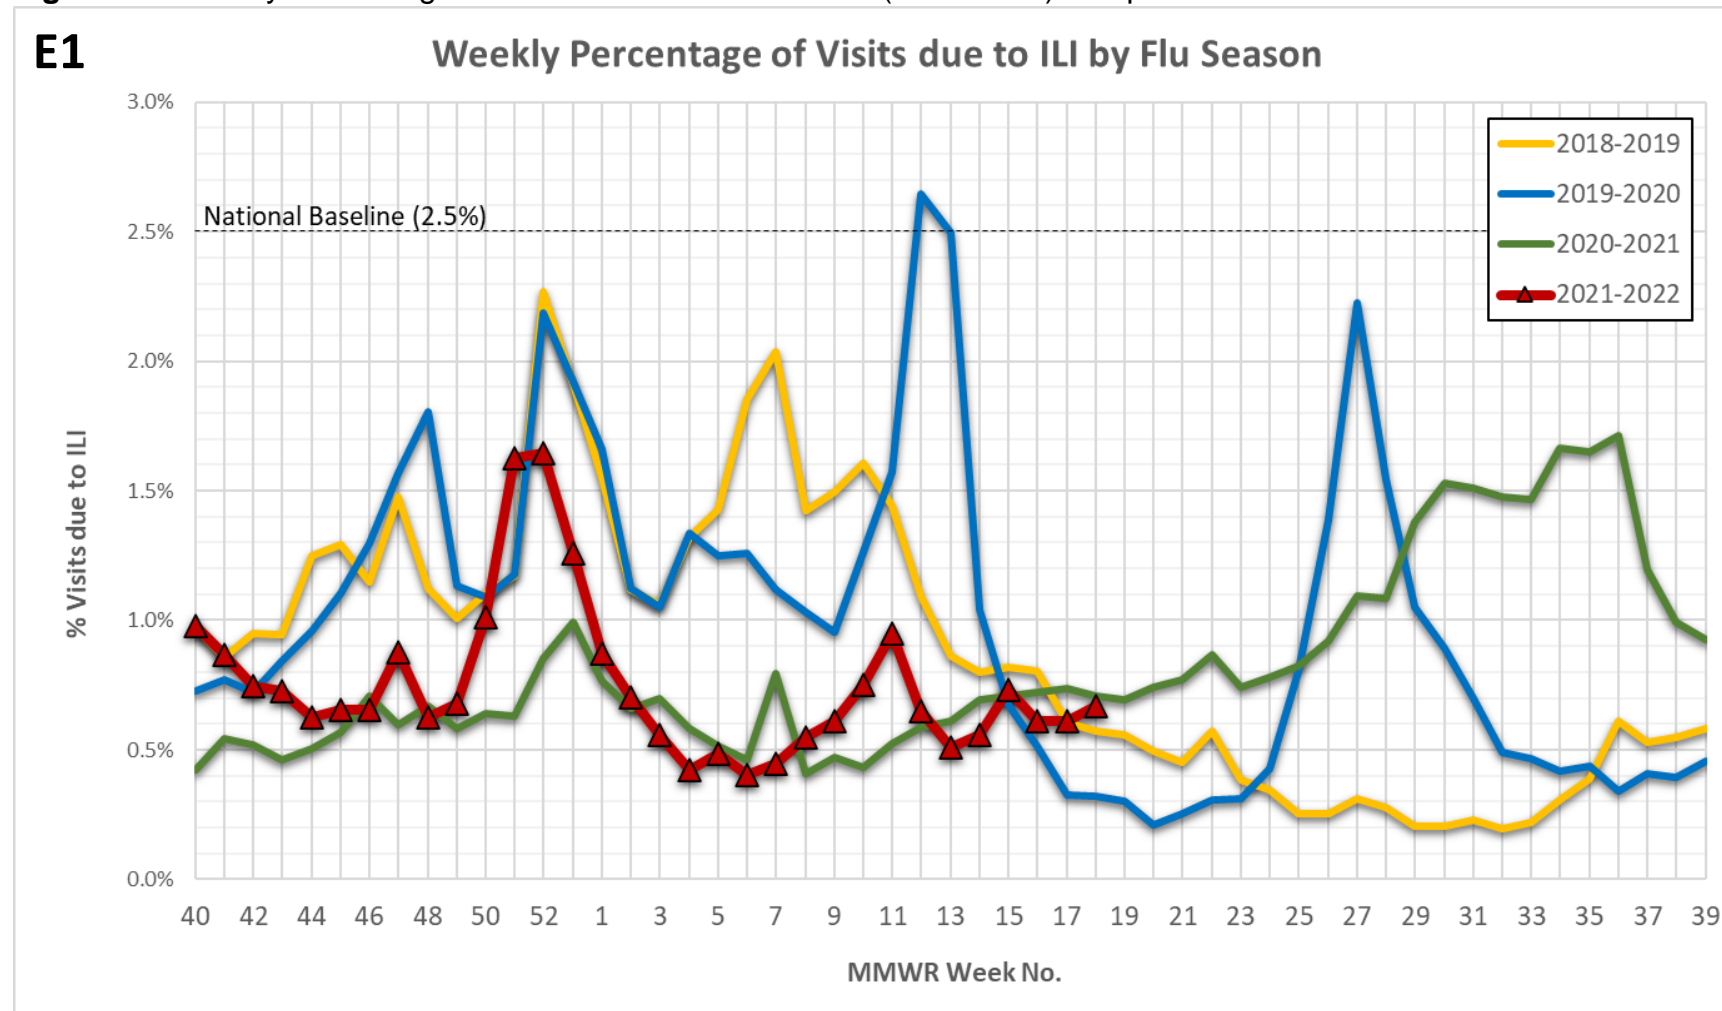

Figure D1. Weekly Percentage of Visits due to ILI by Age Group (with 5-week Moving Averages).

Figure D2. Weekly Percentage of Visits due to Discharge Diagnosed Influenza by Age Group (with 5-week Moving Averages).

Recently, children under 18 have a slightly higher percentage of visits due to ILI compared to adults 18 and over (no change from previous week). Both age groups are on a steady/slight downward trend for this measure.

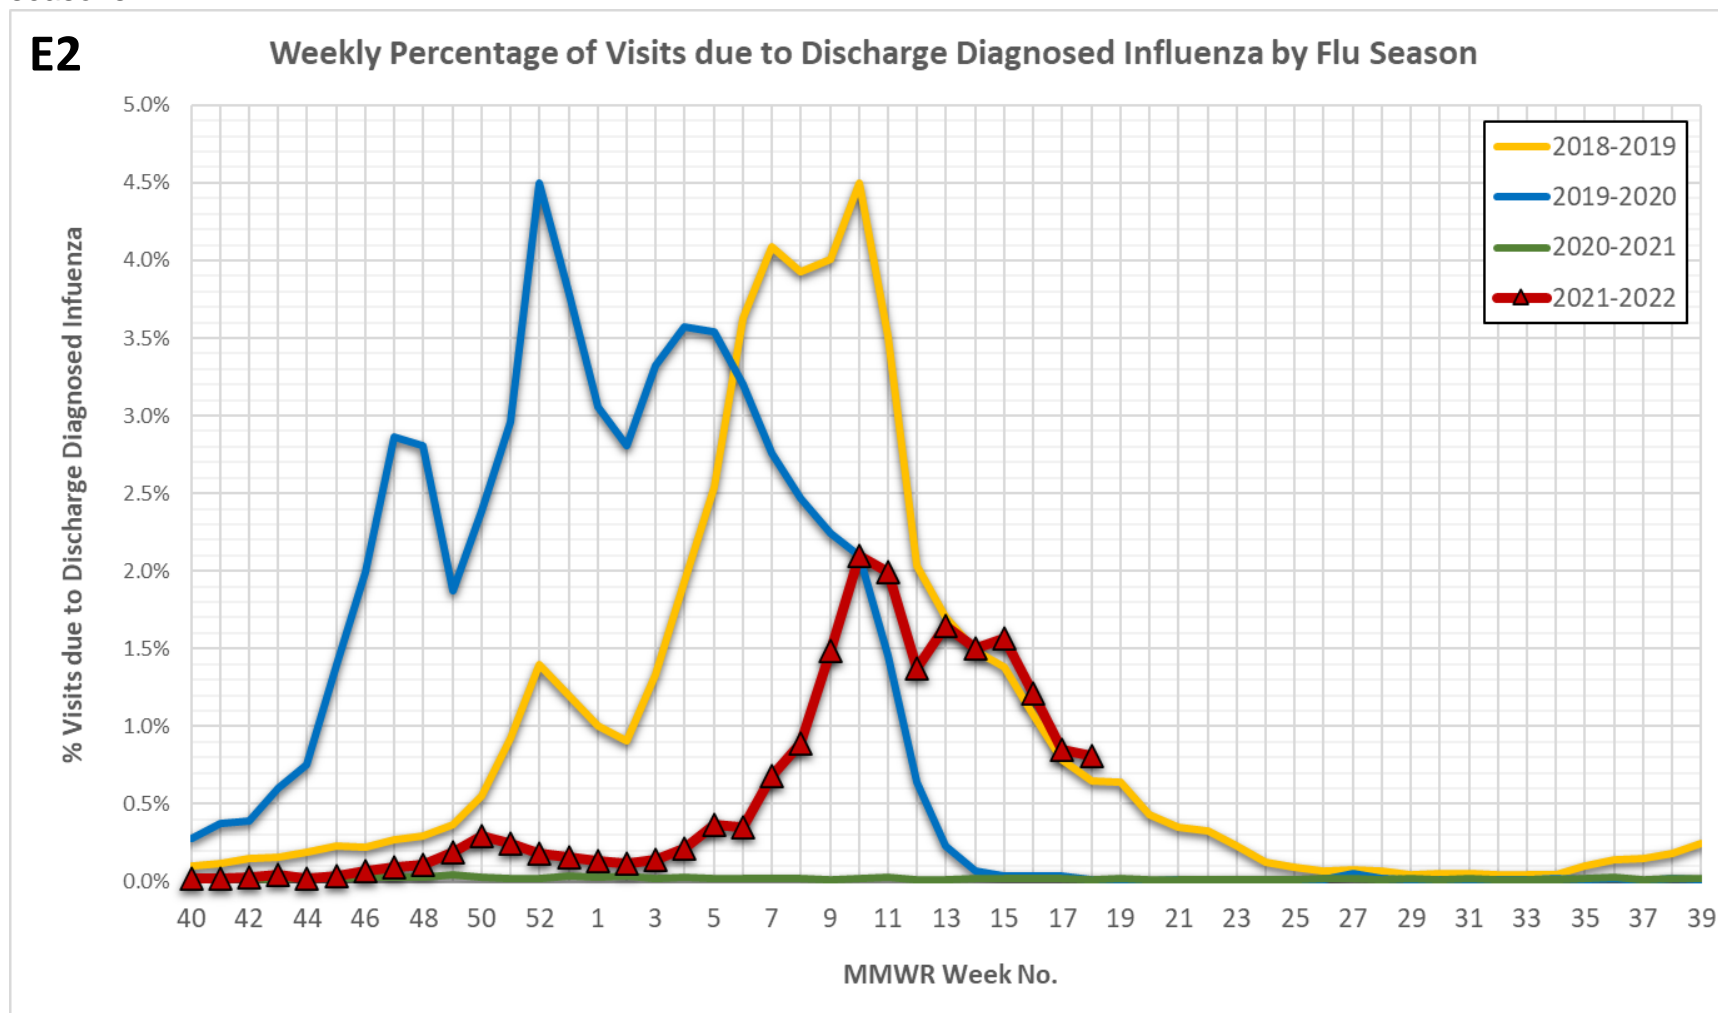

Recently, children under 18 have a higher percentage of visits due to discharge diagnosed influenza compared to adults 18 and over (no change from previous week). Both age groups are on a downward trend for this measure.

Figure E1. Weekly Percentage of Visits due to ILI for current (2021-2022) and previous seasons.

Note: 2020 has 53 weeks. Week 53 for 2019 and 2021 are the averages of Week 52 of the given year with Week 1 of the next year.

Figure E2. Weekly Percentage of Visits due to Discharge Diagnosed Influenza for current (2021-2022) and previous seasons.

Note: 2020 has 53 weeks. Week 53 for 2019 and 2021 are the averages of Week 52 of the given year with Week 1 of the next year.

	Total Visits		ILI Visits		Discharge Diagnosed Influenza Visits	
	#	%	#	%	#	%
Under 5	609,153	28%	6,662	43%	3544	29%
5 to 17	841,412	39%	4,680	30%	7690	62%
18 to 39	399,769	19%	2,474	16%	848	7%
40 to 59	153,434	7%	1,149	7%	147	1%
60 to 79	105,211	5%	571	4%	106	1%
80 plus	31,797	1%	112	1%	40	0%
Total	2,140,776		15,648		12,375	

Table 1. For MMWR 2021 Week 40 to 2022 Week 18 (October 3rd, 2021 to May 7th, 2022), the count breakdown for total visits, ILI visits, and discharge diagnosed influenza visits by age group.

APPENDIX

Data Source & Method

Data Source: Three main types of visit data from the Southeast Texas Syndromic Surveillance System (HHD-ESSENCE) were used in this analysis: total visits to the facilities, influenza-like illness (ILI) visits, and discharge diagnosed influenza visits. The queries used searched for “ILI” in the Syndrome field and/or Influenza ICD codes in the Discharge Diagnosis field. ILI records are defined by the Chief Complaint field ([containing flu-like symptoms, e.g., fever plus cough or sore throat](#)) and could have other non-Influenza cases in the Discharge Diagnosis field (e.g., RSV or COVID). Any record where “Z23” (i.e., “Encounter for immunization”) was listed as the only code in Discharge Diagnosis was removed from ILI and Discharge Diagnosed Influenza records. Any record that did not have “Harris” in the county field or one of the 105 city of Houston-associated zip codes in the patient zip code field was removed.

Method:

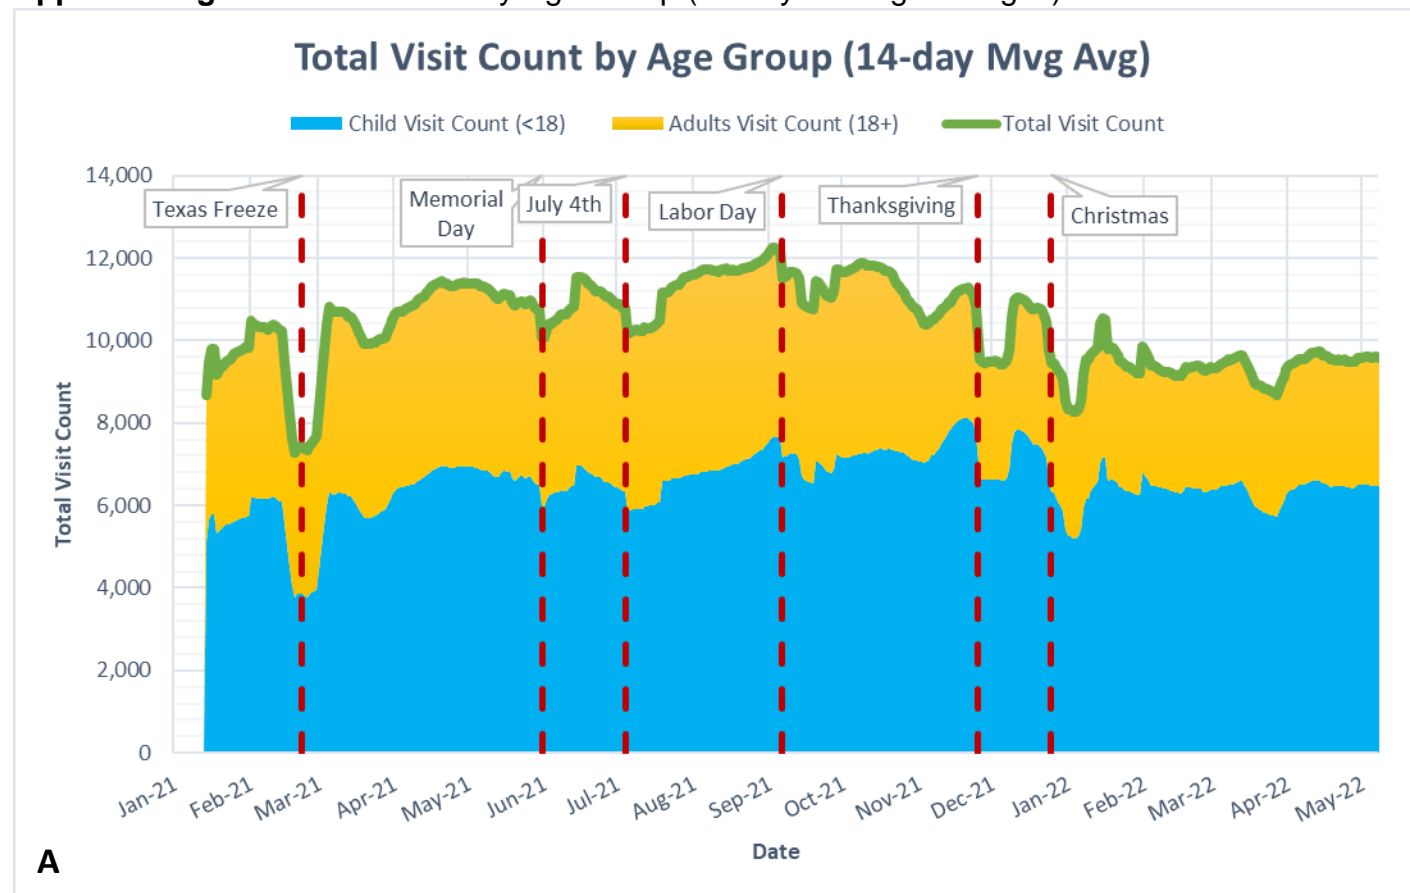

1. Weekly counts were calculated for ILI and discharge diagnosed influenza facility visits.
2. Weekly counts are shown in figures with a 5-week moving average (average of current week with previous 4 weeks) of the count.
3. The percentage of facility visits due to ILI was calculated on a weekly basis:

$$\% \text{ of Visits due to ILI (weekly)} = \frac{\# \text{ of visits due to ILI in week}}{\# \text{ of visits in week}}$$

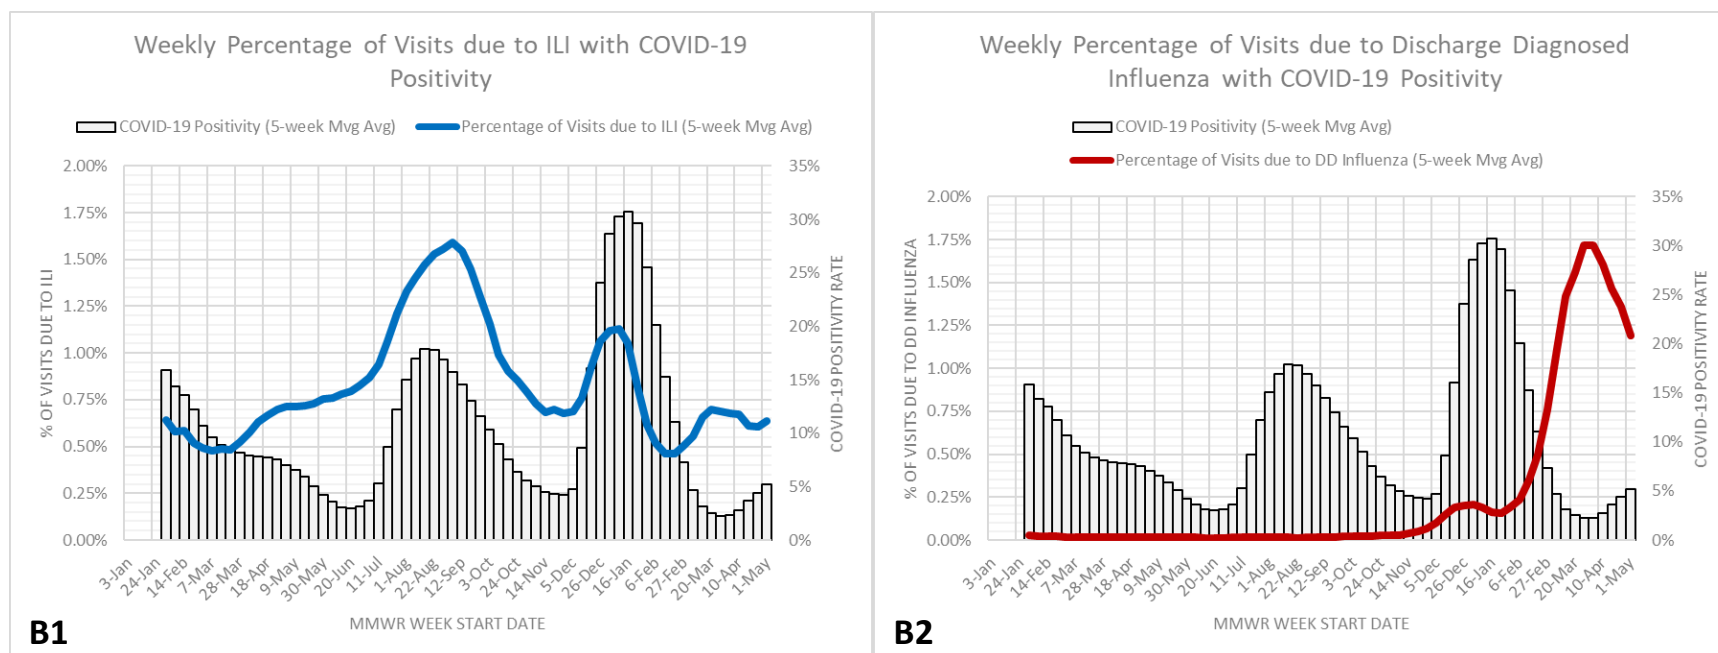

4. The percentage of facility visits due to discharge diagnosed Influenza was calculated.

$$\begin{aligned} \% \text{ of Visits due to Discharge Diagnosed Influenza (weekly)} \\ = \frac{\# \text{ of visits due to Discharge Diagnosed Influenza in week}}{\# \text{ of visits in week}} \end{aligned}$$

5. The 5-week moving average of these values was calculated and shown in figures.
6. Other tables and figures show similar values by age group or with respect to average temperature and relative humidity.

Appendix Figure A. Total Visits by Age Group (14-day Moving Averages).

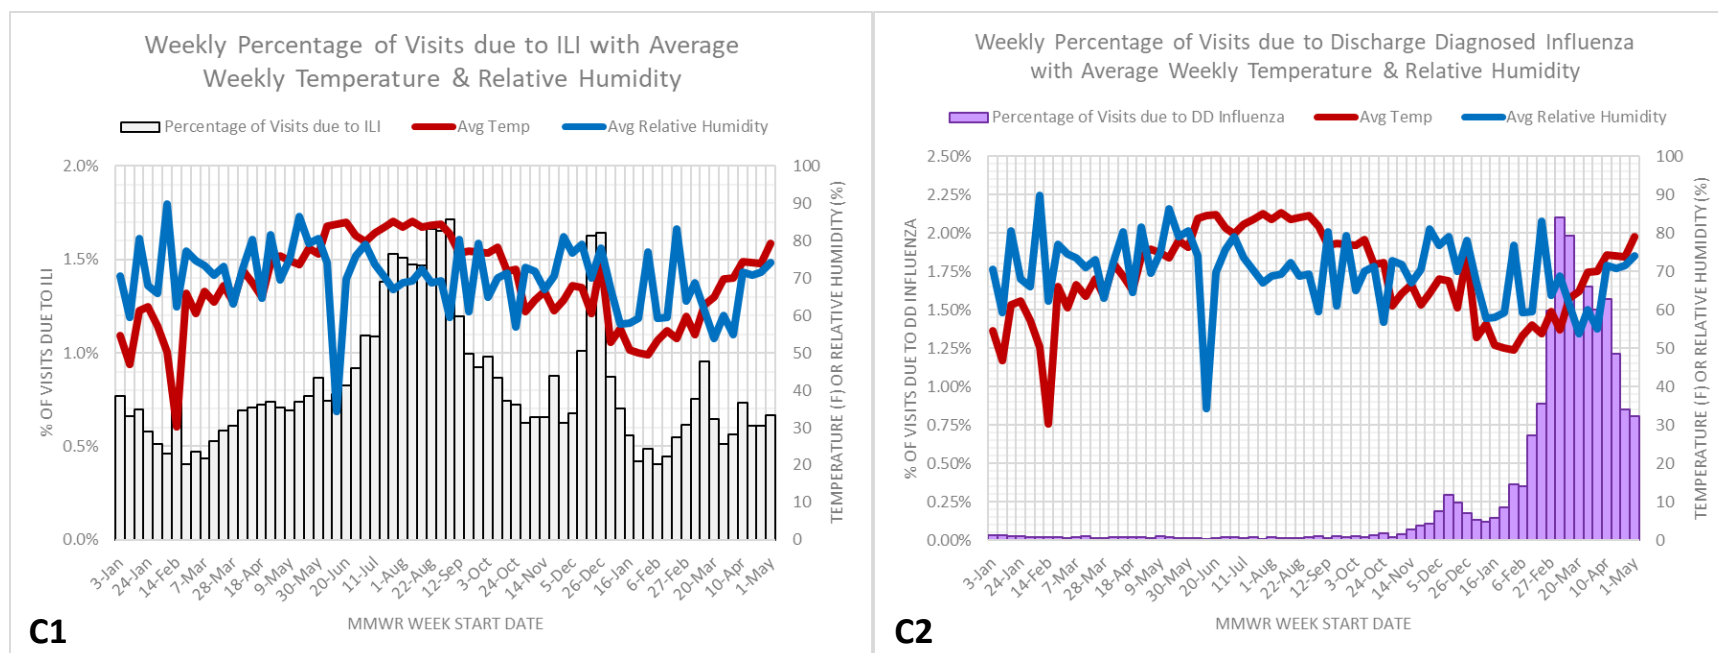

Total daily visit counts have stayed fairly consistent throughout the year, with drops in counts tending to coincide with major events or holidays (e.g., February Freeze, July 4th, and Thanksgiving Week).

Appendix Figure B1. The Weekly Percentage of Visits due to ILI with the 5-week moving average COVID-19 Positivity Rate for COH.

Appendix Figure B2. The Weekly Percentage of Visits due to Discharge Diagnosed Influenza with the 5-week moving average COVID-19 Positivity Rate for COH.

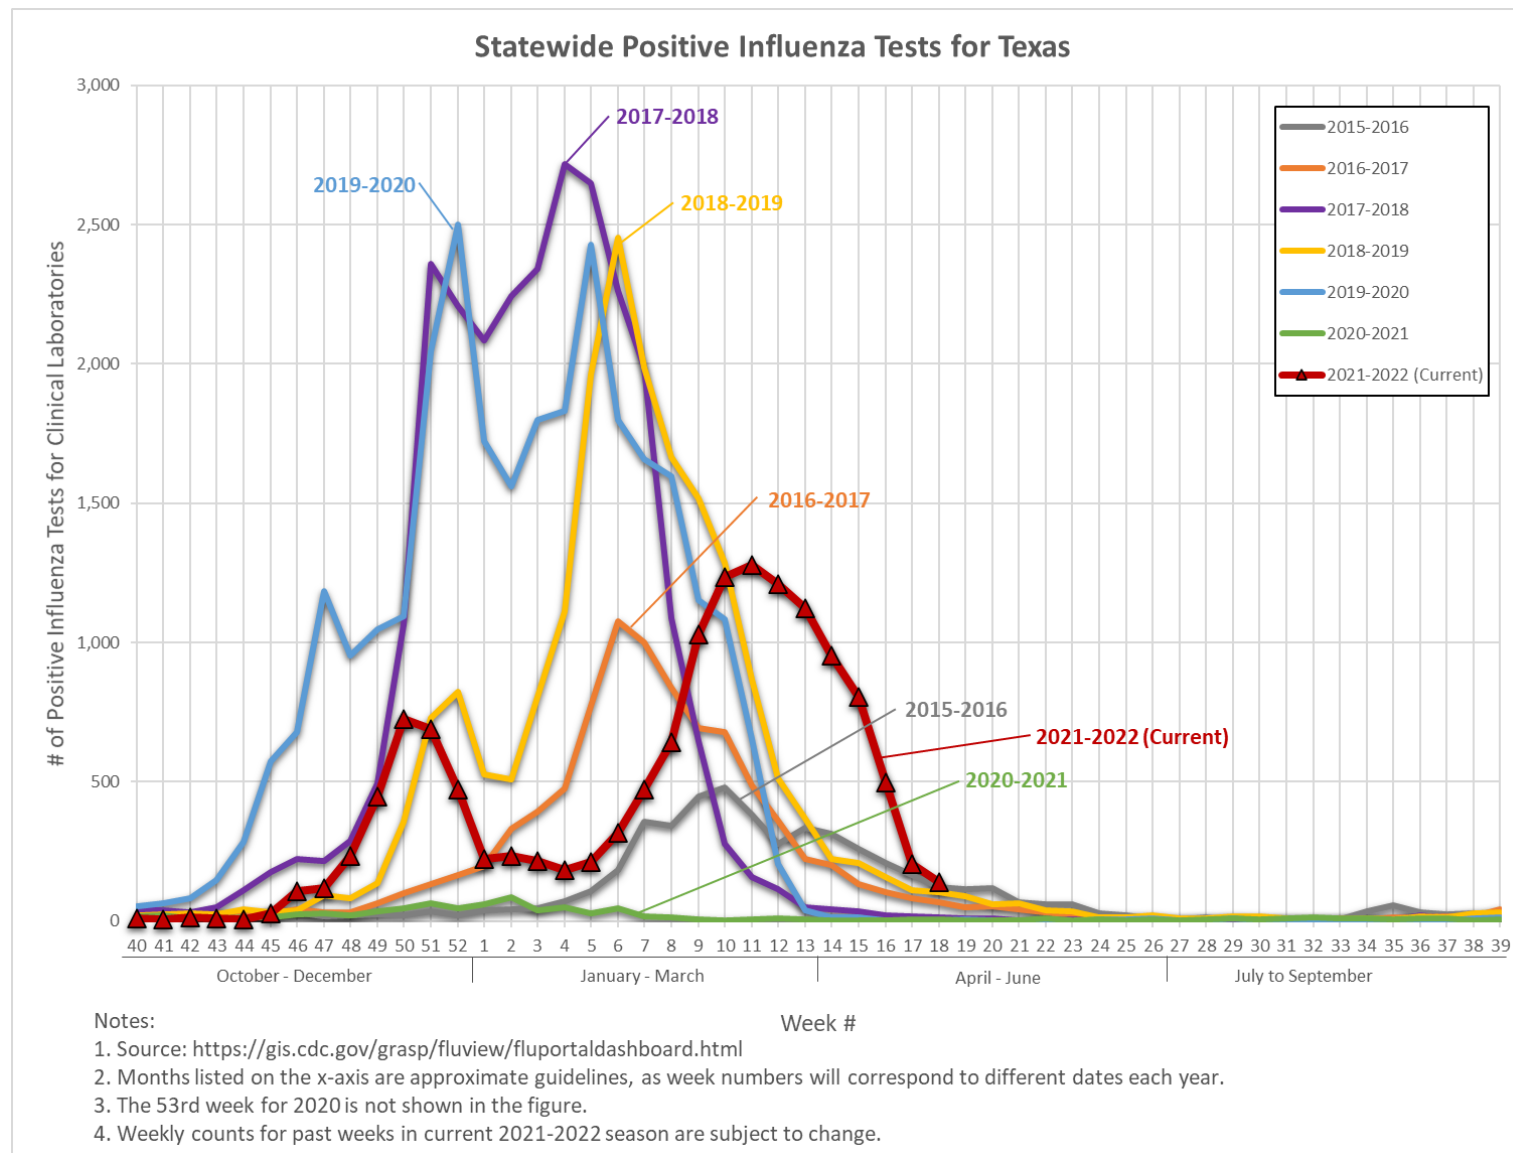

NOTE: Positivity rate as of 5/13/2022.

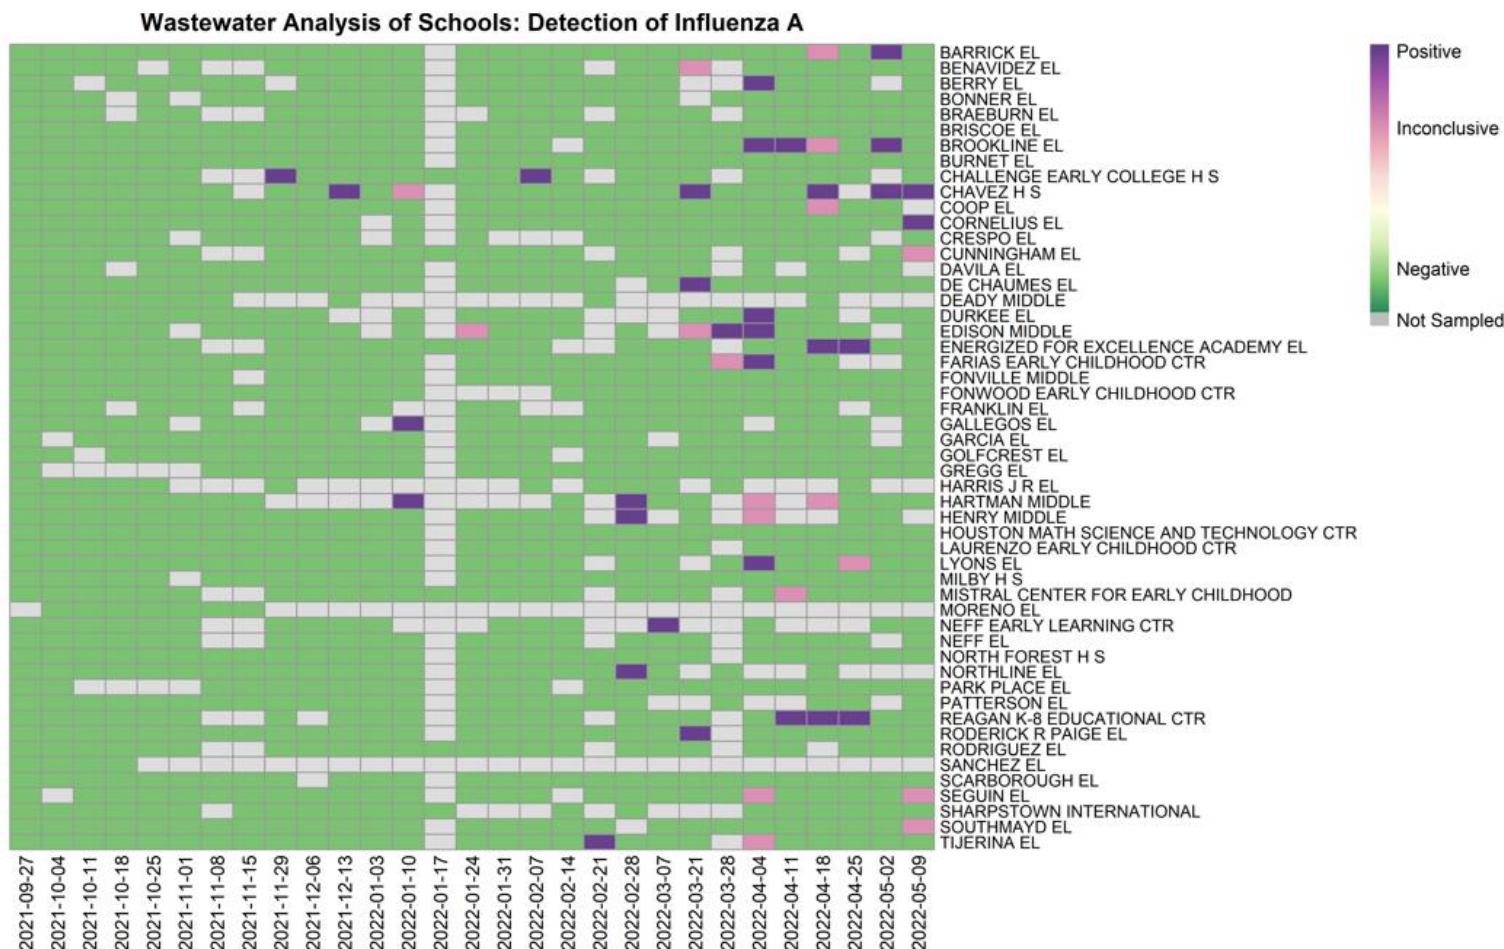

Appendix Figure C1. The Weekly Percentage of Visits due to ILI with the Average Weekly Temperature and Relative Humidity.

Appendix Figure C2. The Weekly Percentage of Visits due to Discharge Diagnosed Influenza with Average Weekly Temperature and Relative Humidity.

Statewide Positive Influenza Tests for Texas

Wastewater Analysis of Schools: Influenza

For 5/9/2022:

- 2 schools tested positive for Influenza A: Chavez High School (2nd week in a row) and Cornelius Elementary.
- 3 schools had an inconclusive result: Cunningham Elementary, Seguin Elementary and Southmayd Elementary.
- All other schools sampled tested negative.
